

E-P HYREG[®]

VY1 Series

This hybrid regulator combines a regulator and a solenoid valve.

Stepless control through electric signals

Port sizes M5 to 2 inches can be covered by combining an ultra-compact electro-pneumatic pilot valve and a 3 port high-capacity exhaust main regulator.

Simple circuit configuration

Simplified main circuit

Simplified pilot circuit

Piping labor reduced
A flexible system has been adopted.

E-P HYREG[®]

VY1D00

VY1400

Application example

Capable of performing multistage pressure control and stepless pressure control by varying the electrical signals.

Cylinder Thrust Control

Tension control balancer

Drive and Thrust Control

Cylinder behavior and pressurization control for peening and stamping

Example

Welding pressure control of spot welding gun cylinder
Loading cylinder control

Flow Control of Various Fluids

For remote control of another air operated valve

Pressure Control of Tank

Automatic adjustments

Air Flow Control of Nozzle ^(Note)

Air blowing
Air cooling

^(Note) Use for the sonic flow.

Ease of handling

Having the amplifier built into the electro-pneumatic pilot valve, only an external power supply and signal (voltage, current) need to be connected.

Manifold capable

Using the VVEXB/2/4 series, a maximum 10 station manifold is possible.

2. Exhaust Time from 10 L Tank

Exhaust Time from 1000 L Tank

3. Exhaust time from optional pressure point

Ex.) Using VY1500, lower the 500 L tank pressure from 0.4 to 0.1.

a) If describing the above graph in accordance with graphs, the exhaust time is read; 27 - 3 = 24 s.

b) Then, to convert the time into one from a 500 L tank.

$$t = \frac{\text{Tank capacity}}{1000} \times \left[\text{Read exhaust time} \right]$$

$$= \frac{500}{1000} \times 24$$

$$= 12$$

Then, the result is 12 s.

Exhaust Time

1. Exhaust Time from 0.5 MPa to 0.1 MPa

Exhaust Time from 0.5 MPa to 0.1 MPa

Construction/Component Parts/Working Principle

VY1D00

The VY1D00, which is the smallest direct drive, consists of a solenoid, pressure sensor, control circuit, body cover, and a sub-plate. The type with sub-plate can be used alone, and the type without sub-plate can also be used as a pilot valve.

Working principle

- When the command signal is below 1 VDC, (refer to page 992) the solenoid valve is inactive, and the port 2(A) pressure is zero.
 - When a command signal between 1 and 5 VDC is provided, the solenoid is activated.
 - The port 2(A) pressure is fed back to the control circuit by the pressure sensor.
 - The control circuit compares the feedback signal with the size of the command signal that was provided, and:
 - 1) If the feedback signal is smaller, current is supplied to the solenoid valve to raise the port 2(A) pressure [from 1(P) to 2(A)].
 - 2) If the feedback signal is greater, current is not supplied to valve to reduce the port 2(A) pressure [from 2(A) to 3(R)].
- The above processes 1) and 2) are repeated at high speeds to set the port 2(A) pressure.

Circuit

VY1A0⁰, VY1B0⁰ (Pilot valve: VY1D00-□00)

Working principle

- The supply [1(P) to 2(A)] valve of valve ① and the exhaust [2(A) to 3(R)] valve close due to the balance between actuating forces F1 and F2. Actuating force F1 is applied to the right surface of pressure regulation piston ③ by the pilot pressure (pilot valve assembly ②: VY1D00-□00), and actuating force F2 is applied to the left surface of the pressure regulation piston by the port and pressure that passes through the feedback passage. Thus, the port 2(A) pressure that corresponds to the pilot pressure is established.
- When the port 2(A) pressure becomes higher than the pilot pressure, F2 becomes greater than F1. This causes only the pressure regulation piston to move to the right, and the exhaust valve seat to open, allowing the air to be discharged from port 2(A) to port 3(R). When the port 2(A) pressure drops to reach a balance, the regulator returns to the set state.
- Conversely, if the port 2(A) pressure is lower than the pilot pressure, F2 becomes lower than F1. This causes the pressure regulating piston to move the valve to the left, and the supply valve seat to open, allowing the air to be supplied from port 1(P) to port 2(A). When the port 2(A) pressure balances, the regulator returns to the set state.

Component Parts

Construction/Component Parts/Working Principle

VY110⁰, VY120⁰, VY130⁰, VY140⁰ (Pilot valve: VY1D00-□00)
 VY150⁰, VY170⁰, VY190⁰ (Pilot valve: VY1B00-□00)

Working principle

- The pair of poppet valves ⑦ close due to the balance between actuating forces F1 and F2. Actuating force F1 is applied to the top surface of pressure regulation piston ④ by the pilot pressure (pilot valve assembly ①: VY1⁰00-□00), and actuating force F2 is applied to the bottom surface of the piston by the port 2(A) pressure that passes through the feedback passage. Thus, the port 2(A) pressure that corresponds to the pilot pressure is established. The poppet valve, which maintains a pressure balance with the port 2(A) pressure, is backed up by spring ⑤ (refer to the diagram on the left).
- When the port 2(A) pressure becomes higher than the pilot pressure, F2 becomes higher than F1. This causes the pressure regulation piston to move upward, and the top poppet valve to open, allowing the air to be discharged from port 2(A) to port 3(R). When the port 2(A) pressure drops to reach a balance, the regulator returns to the state shown in the diagram to the left.
- Conversely, if the port 2(A) pressure is lower than the pilot pressure, F2 becomes less than F1. This causes the pressure regulation piston to move downward, and the lower poppet valve to open, allowing the air to be supplied from port 1(P) to port 2(A). When the port 2(A) pressure rises to reach a balance, the regulator returns to the state shown in the diagram to the left.

Component Parts

No.	Description	Material

1 Low Wattage Specification: 0.8 W or less

-X39

Under operating conditions that the ON time, such as charging to the tank is long, the service life may be shortened due to the heat generation of the product. When the operating pressure is 0.7 MPa or less, it is recommended to use the special product “-X39” (Service life: Approx. 7000 operating hours) that is a type of low wattage and suppresses heat generation. Please note that the product characteristics are those with 0.7 MPa or less of the standard specifications.

Note 3) Only bracket or foot may be mounted.

Note 4) When replacing the pilot valve, it may not satisfy characteristics such as accuracy, etc. Confirm the product works under the operating conditions before using. If SMC is requested to repair the product, SMC confirms whether characteristics are satisfied.

Note 5) □ In the applicable pilot valve part number is designated for the power source/command signal.

Note 6) Face seal type One-touch fittings cannot be used.

Specifications (Specifications other than those below are the same as the standard type.)

Max. operating pressure ⁽⁷⁾	0.7 MPa
Regulating pressure range	0.05 to 0.66 MPa (Supply pressure 0.7 MPa)
External pilot pressure	Set pressure +0.04 MPa to 0.7 MPa
Command signal ⁽⁸⁾	1 to 4 VDC, 0 to 7.5 VDC, 4 to 16 mA DC, 0 to 15 mA DC
Power supply	12 VDC ±10%, 24 VDC ±10%, 0.8 W or less
Bleed air flow (Pilot EXH port)	When not operating: Zero, When operating: 7 L/min (ANR) (Supply pressure 0.7 MPa)

Note 7) The supply pressure must be under the maximum operating pressure.

If the supply pressure exceeds the maximum operating pressure, this may cause abnormal leakage from the pilot valve or abnormal set pressure to occur.

Note 8) Cut off the command signal when the pressure control on the outlet side is not required, such as when the line is temporarily halted, etc. Refer to Specific Product Precautions on page 1006.

E-P HYREG® Manifold Specifications

Using the VVEXB/2/4 series, a maximum of 10 stations manifold is possible.

Specifications

Applicable valve	VY1B0 ⁰	VY120 ⁰	VY140 ⁰
Valve stations ⁽¹⁾	2 to 10 stations	2 to 8 stations	2 to 6 stations
Passage	Common supply/exhaust		
Pilot type	Internal pilot, Common external pilot ⁽²⁾		
Pilot port size	M5		
Port size port 1(P), 2(A), 3(R)	1/8	1/4	1/4, 3/8, 1/2
Blanking plate assembly ⁽³⁾	VEXB-6	VEX1-17	VEX4-5

Note 1) VY1B0⁰: 6 stations or more, VY120⁰: 5 stations or more, VY140⁰: 4 stations or more supply pressure to the ports 1(P) on both sides of the manifold and exhaust pressure from the port 3(R) on the both sides.

Note 2) When used as a common external pilot, select the internal pilot specification as an applicable valve.

Note 3) Gasket and mounting bolts are equipped.

How to Order

VVEX **B** - **1** - **5** - **01** □

	Body size	Pilot type	Valve stations	Port size

Specific Product Precautions

Be sure to read this before handling the products. Refer to back page 50 for Safety Instructions and each Best Pneumatics for Precautions on every series.

Piping

⚠ Caution

Tightening the fittings and their torque

When screwing fittings into the valves, make sure to tighten them to the proper torque values given below.

● Connection thread: M5

First, tighten by hand, then use a wrench appropriate for the hexagon flats of the body to tighten an additional 1/6 to 1/4 turn. A reference value for the tightening torque is 1 to 1.5 N·m.

- For the fitting with sealant R or NPT, first, tighten it by hand, then use a wrench appropriate for the hexagon flats of the body to tighten it a further two or three turns. For a tightening torque guide, refer to the table below.

Connection thread size (R, NPT)	Proper tightening torque (N·m)
1/8	3 to 5
1/4	8 to 12
3/8	15 to 20
1/2	20 to 25
3/4	28 to 30
1	36 to 38
1 1/4	40 to 42
1 1/2	48 to 50
2	48 to 50

Operating Fluid

⚠ Caution

1. If drainage or debris is present in the supply pressure line, the sliding resistance of the main valve or piston, etc. increases, resulting in a malfunction. Therefore, in addition to the air filter (SMC's AF series), make sure to use a mist separator (SMC's AM, AFM series). Concerning the quality of the operating air, refer to SMC's air preparation equipment selection guide (pages 2 and 3).
2. Make sure to perform a maintenance periodically on air filter and mist separator (by discharging the drain and cleaning a filter element or replacing with new one).

Pressure Gauge

⚠ Caution

For products with pressure gauge, use caution about the durability of a pressure gauge, since it may be affected by the sudden pressure changes during operation.

Wires to be Used

⚠ Caution

Use 3 core shielded wires measuring 0.5 (mm²) for the power supply and signal lines according to the respective number of conductors. When connecting the shielded braided wire, connect it to the ground of the signal generator. As a rule, the electro-pneumatic hybrid regulator should be installed in a location that is free of noise or is shielded. If it must be installed in an environment with poor noise conditions, eliminate the power supply noise by using a line filter, Z-wrap, or a spark killer on the 100 V power supply or signal source line. The length of the power supply and signal lines must be kept as short as possible.

Related Products:

Silencer (AN series)

- Noise reducing effect: 30 dB or more.
- Large effective area
- Refer to Best Pneumatics No. 7 for details.

How to Use DIN Terminal

⚠ Caution

• Wiring procedures

1. Loosen the retaining screw and pull the connector from the solenoid valve terminal block.
2. Remove the retaining screw, insert a flat head screwdriver into the groove below the terminal block and pry it up to separate the terminal block from the housing.
3. Loosen the terminal screws (slot head screws) on the terminal block. Then, in accordance with the wiring procedure, insert the cord of the lead wires into the terminals and tighten the terminal screws to secure in place.
4. Tighten the ground nut to secure the cord.

• Outlet changing procedure

After the terminal block has been separated from its housing, reassemble the housing in the desired direction (in four 90° increments) to change the direction of the cord outlet.

• Precautions

Kindly insert the connector straight in without tilting it, and pull it out straight.

• Applicable wire

Cord external diameter: ø4 to ø6.5
c.f. 0.5 mm² 3 core wire
(JIS C 3306 equivalent)

• Connector part no.: VK300-82-1

Input Signal

⚠ Caution

• Input signal when out of operation

There is dispersion in operation start voltage (current) for the input signal. (Refer to page 992.) If the command signal when out of operation exceeds the lower limit of the operation start voltage (current), the solenoid valve inside the pilot valve starts to activate and may be in the operation state. The service life of this product varies depending on the operating time of the solenoid valve inside the pilot valve. Be sure to cut off the command signal when the pressure control on the outlet side is not required, such as when the line is temporarily halted, etc. (Refer to "Service Life" below.)

Service Life

⚠ Caution

The pilot valve service life is approximately 4000 to 5000 operating hours. (When using AF + AFM) This may be approximately 3000 hours with ultra-dry air (dew point -40°C or equivalent). For the low wattage specification (X39), the service life is approximately 7000 operating hours. (When using AF and AFM)

Bleed

⚠ Caution

Since the pilot solenoid valve enters the normally operating status and the air is discharged continuously from the pilot EXH port (port 3 (R) for VY1D00, VY1A0□ and VY1B0□) in the pressure setting status, the bleed sound is produced. However, this is not an abnormal phenomenon.
